

GRIP FIX – Palletizing adhesivestest facilities

HMJ offers safety systems based on GRIP FIX palletizing adhesives.

Bag-fix combiguns

GRIP FIX anti-slip agents are water-soluble, solvent-free adhesives for securing pallet loads. The pallet loads may be PE bags, paper bags, cartons, cellophane-packed items, PP woven bags or small packages.

How does GRIP FIX work?

GRIP FIX is applied in small quantities to the pallet loads before they are palletized. After minimal drying time, the pallets become stable and remains so until they are unloaded.

What is the secret to all this? High shear strength and very low peeling strength. The pallet loads do not slip and the packages can be easily separated.

In general, GRIP FIX leaves no residue after depalletizing.

How to use GRIP FIX?

Using GRIP FIX is straightforward

owing to our quick-connector system. Regardless of whether our palletizing adhesives is supplied from a canister or a drum, the container can be connected very easily to the system with the quick connector. This produces a closed system where no dirt can enter the container, and the anti-slip agent remains uncontaminated and does not dry out. In addition, refilling is unnecessary. Another advantage depending upon your requirements: we supply our GRIP FIX in a range of container sizes from 1 kg. hand-held bottles through to 1.000 kg. containers.
